The longer cord should be arranged so that it will not drape over the countertop or table top where it can be pulled on by children or tripped over. Your product is equipped with a polarized alternating current line plug a plug having one blade wider than the other. This plug will fit into the power outlet only one way. This is a safety feature. If you are unable to insert the plug fully into the outlet, try reversing the plug. If the plug should still fail to fit, contact your electrician to replace your obsolete outlet. Do not defeat the safety purpose of the polarized plug. 5 bar 14 USA 30072001 1351 Pagina 6 USE OF THE MACHINE THIS MACHINE IS FOR HOUSEHOLD USE ONLY When using for the first

time After unpacking the appliance, remove the plastic bag containing the accessories. All accessories filterholder, measuring spoon, two filters must be washed with detergent and lukewarm water, then rinsed thoroughly.<http://www.emjar.pl/zdjecia/fck/bosch-manual-pull-station.xml>

Then the internal circuit should be washed as follows Filling the reservoir Remove the tank cover and pour fresh water into the tank fig. 1. In some models the tank can be removed by lifting it upwards and, at the same time, lifting the intake tubes fig. 2. Rinse the tank and fill with cold water to the upper mark MAX., then replace the tank in its housing, ensuring that the tubes are immersed in the water. Wait until water begins to flow from the boiler nozzle; then turn the delivery switch off. The machine is now ready for use. Positioning the filterholder To insert the filterholder in the machine, position it under the nozzle fig. 6. Then push the filter holder upwards and at the same time rotate it towards the right as far as it will go. When making coffee after using the machine to produce steam, it is advisable to let the water flow from the boiler nozzle in order to bring the machine back to the ideal temperature required to make a perfect cup of coffee. Topquality beans, correctly roasted and ground, will always produce the best coffee. A few drop of water may escape from the boiler nozzle. This is perfectly normal. Insert the 1 or 2cup filter fig. 7. Place 1 or 2 measures of ground coffee in the filter. Your user manual DELONGHI CA F FE TREVISO BAR 14 F Powered by TCPDF [www.tcpdf.org](http://www.tcpdf.org). The machine includes a twocup filter, steam nozzle, drip tray, pilot lamp and illuminated lights and switches. Sold online and in select culinary supply stores, appliance stores and department stores, the appliance lets you brew your own specialty coffee drinks. While the operating instructions are generally straightforward, children should never be allowed to use or play with the appliance to reduce the possible risk of injury. The DeLonghi espresso maker lets you brew your own specialty coffee drinks at home. Fill the filter with one or two teaspoons of ground espresso in the filter, depending upon the desired amount. Press down lightly on the coffee to tamper.

Close the filter holder, pushing it to the right as far as possible. Set the cup or cups on the drip tray. Fill the water reservoir with the desired amount of cold water. Wait for the coffee to brew into the cups. Wait until the coffee maker has cooled before removing the filter to discard the used coffee grounds. Wait three minutes, then slide the steam nozzle into the milk pitcher until submerged. Turn the steam control knob counterclockwise and raise and lower the milk to froth. Turn the steam knob off when finished and remove the pitcher. Use a cloth to unscrew the steam nozzle and rinse immediately to prevent milk residue from forming. She holds a Bachelor of Arts in history from San Francisco State University. We havent been able to figure out how to get it to brew espresso, though we got it to steam. I assume it has something to do with the arrangement of two plastic tubes that are just flopping around, a short one and a long one. We tried putting the long one in with the water as that seemed to make the most sense. Wasnt sure if it was supposed to go down to the water. Also, how long does it take.possibly we didnt wait long enough. Anyway, any info you can give me would be wonderful.Thanks! First off, BOTH tubes go into the water tank. One is to turn the power on and start heating your water up. When you turn this button on ONE light should come on.the OTHER light indicates you are up to the require temperature and ready to go, according to if you are in espresso modea hot water tempor steaming modesteaming temp. The second button is to start pumping the espresso pumpwhen you push it, you will hear a fairly loud vibrating noise, dont worry, its supposed to be that way. The third button is to activated the water heater to heat it up to the higher steam temperature. So here we go, this is how youre supposed to do it Turn the machine on. Open up the steam nozzle and put a cup under it.

<https://skazkina.com/ru/3m-attest-incubator-manual>

Turn on the pump and let it pump until water is coming out of the steam nozzle.this fills the boiler with water Turn off the pumpjust the pump, not the whole machineand turn off the steam nozzle. Wait for the boiler indicator light to show proper temp has been reached. Now, trust me on this, put

the EMPTY filter handle on the machine and turn on the pump of course, put a cup under it Pump until your heat indicator light comes off just an ounce or two the first time. This process brings all your components like the basket and such up to proper temperature. NOW you're ready to make your espresso. Do the same thing like you just did, only this time have your grounds in the basket. Now, if you want to steam, here's what you do AFTER you're finished making your espresso, turn off the pump again, not the machine, just the pump. Sometimes this can take 20-30 seconds. NOW, IF you want to make another espresso, you HAVE to go back to step one and pump water through the steam wand this fills back up the boiler so you have water to make espresso again SHEESH. I'm so sorry this sounds so complicated. I would hate to read this many directions. But believe me, it's really not hard. It's an easy second nature routine after only a few times on your own. Good luck to you and your husband. Me and my wife prefer out homemade to store bought ANYTIME. Stick with it, the rewards are well worth it! Any ideas Okay I think I got it. I think that I was not waiting for it to get hot. Now that I waited for the light to come on I'm getting espresso instead of just water. Guess I need to play with this more. Grinder Major, Super Jolly. Vac Pot Bodum Santos Drip Fetco, Melitta Roaster Sivetz, Diedrich There are high end machines that actually have to have water drawn off the boiler first before pulling a shot or it will be TOO hot but with this machine that should not be the case.

<https://www.melisaking.com/images/Cross-Connection-Control-Manual-New-York.pdf>

It's not a bad idea, however, to draw one shot of plain water through an empty filter basket, then give it a quick dry with a towel and load the coffee this will ensure that the basket and portafilter assembly are as hot as possible. With my DeLonghi I got best results by using the double basket with two slightly rounded scoops of ground espresso that was then tamped with moderate firmness before pulling the shot. Try to end up with a total of about 1.5 oz to 2 oz of liquid in total from a double shot. The amount of time from when you press the button to start and press it to end the shot should be about 26 to 28 seconds. Overly long or short times will result in less desirable taste. With a bit of practice, a decent burr grinder and good fresh beans absolutely critical to success you'll be able to produce drinks better than you're ever likely to get at Starbucks. It keeps the ground coffee in there, snug. What do you call this thing. I have not been able to find any info on this rubber part. My first DeLonghi BAR 14 didn't have one in the box; when I made espresso, the grounds got all over the machine where the water comes out. What a mess! I was a NOVICE and thought something was wrong with the machine also, so I exchanged it for another, same brand, same model, and THIS time, there was this rubber part in the box. I figured it fit over the coffee in the filter, and ever since then, no mess, and I've been using it every day. I tamp it in the filter, insert into the holder, holder into the machine and press the button not the slightest amount of coffee powder has ever escaped. So I've been using this little rubber round thingie all this time, FOR NOTHING. I mean, all it did was keep my machine cleaner. I thought it was PART of the package!! I bet that rubber thing has been messing up my crema. I mean, my espresso makes good coffee drinks, but hardly has a crema to it. This little rubber thing has a tiny hole in the center, to let the water through.

<https://modlingua.com/images/Cross-Connection-Control-Manual-Pacific-Northwest.pdf>

NOW I will try to make a decent espresso without the rubber thing. The water should make MORE surface contact with my tamped espresso, hopefully giving up the crema!! IF this rubber thing isn't part of the machine, and I'm getting the feeling that no one here on this forum uses one, then what on earth is it, and WHY was it in the box with my machine. My machine uses a commercial filter, by the way. No the pressurized one. So maybe this rubber thing goes with a pressurized filter. Did I get the wrong stuff in my box. My portafilter has the straight handle to it. Man, I'm lost.! LOL I had to wipe it all down. Normally, there is no mess there at all when I use the rubber part. I tamped down my coffee, and it expanded and was almost overflowing the filter basket when I removed the portafilter to clean it. I guess I'm stupid, but this IS normal, right. To have all of this expansion, even

when tamped. Im going to keep using my rubber part. Until I can buy a machine with a pressure filter. I had to wipe it all down. Posted July 31, 2006 link Well, I do clean the shower screen and the rim around that after every use, too. But it is not a big deal first a blank shot to an empty cup it removes most of the leftover grounds than a quick wipe with a damp sponge. What makes a really big difference I do get crema, and plenty of that, just like in the bars and most of the time it tastes pretty good without milk. With the usual parameters fresh beans, fine and even grind, careful tamping the Treviso can do it. I guess Im stupid, but this IS normal, right. Posted July 31, 2006 link Certainly it is normal, wet pucks always swell, regardless of the machine used. Until I can buy a machine with a pressure filter. Posted July 31, 2006 link Why would you. Pressurized portafilters are pure evil. They simulate, not make good espresso, so that using one could hold up your own advance. Boy, do I have A LOT to learn. I thought the more expensive machines used pressurized filters.

I think what has me confused are all the pics on this forum of coffee, beautiful coffee, coming out of a bottomless portafilter. What type of portafilter is that. My Delonghis portafilter just has this tiny hole on the bottom where the coffee streams out. And can you tell me also where the water comes out of the machine, can this part be removed in the Delonghi to be cleaned. Or is that only done on the much more expensive machines. I have never taken mine apart, and Im scared to, because if I mess it up, I wont have ANY espresso. Not with a busted machine. But I am thinking I sure would like to clean it somehow. Thanks for ALL of your help and your great answers. I sure do appreciate it!! No SEO style postings will be tolerated. SEO related posts will result in immediate ban from CoffeeGeek.
